## **Project #1**

Project Title : Online Mall Management  
Operating System : Windows XP  
Browsers Tested on : FireFox

### **Project description:**

Online Mall Management is an online trading and auction community where millions of people buy and sell millions of items every day. Buyers can find great deals on all kinds of items. Online Mall Management have three type of services Shopping ,Movie box and Cab service. Items like cloths, bags, shoes in the shopping site can be found on Online Mall Management . Sellers can market their product to millions of daily visitors. This makes using Online Mall Management one of the most efficient ways to sell just about anything. Everybody can connect with others who share a common interest.

Most of the selling on Online Mall Management occurs in Add to cart or Buy It Now format. It all begins when the seller posts the item on Online Mall for a specified duration of time. Potential buyers search for items and bid on those they are interested in purchasing. At this point, the buyer and seller make arrangements for payment and shipping. After payment is made and the item is delivered, the buyer and seller are strongly recommended to use Online Mall Feedback Profile. This will allow other users to review users their experiences on Online Mall . All of this takes place in a safe and secure environment

### Responsibilities

- Analyzing and Understanding System Requirement

## **Project #2**

**Project title: CRYPTOGRAPHY KEY GENERATOR FOR LTE NETWORKS  
USING SESSION KEYS**

**Domain:** Network security

### **Project description:**

we were concerned that forward key separation in handover key management in the 3GPP LTE/SAE network can be threatened because of what are known as rogue base station attacks. Although periodically updating the root key minimizes the effect of the attacks, selecting an optimal key update interval is an ill-defined problem because of the difficulty of achieving a balance between the signaling load and the volume of exposed packets. We have derived a mathematical framework for selecting an optimal handover key update interval that helps a network operator select an optimal value that fits best with network management policies.
